

Distribution Box Branch Transformer

Overview

Distribution transformers consist of a magnetic core made from laminations of sheet silicon steel (transformer steel) stacked and either glued together with resin or banded together with steel straps, with the primary and secondary wire windings wrapped around them. This core construction is designed to reduce core losses and dissipation of magnetic energy as heat in the core, an econom. OverviewA distribution transformer or service transformer is a that provides a final reduction in the system, stepping down the voltage used in the distribution lines to the level used. Distribution transformers are classified into different categories based on factors such as:

- Mounting location - pole, pad, underground vault
- Type of insulation - liquid-imme.

Distribution transformers are normally located at a, where wires run from a utility pole or underground power lines to a customer's premises. They are often used for the power supply of facilities outside sett.
