

# Does the AP panel need to be connected to fiber optic or a regular network cable

## Overview

Normal Access Point: Uses copper cabling, limited to 100 meters and susceptible to electromagnetic interference. Fiber Connected Access Point: Uses fiber optic cabling to connect directly to fiber backbones over much longer distances — hundreds of meters to kilometers — without. Normal Access Point: Uses Ethernet ports (RJ45), typically 100M/1G ports, to connect to a switch or router. Some of the key features include: 320 MHz Channel Width: Double the maximum channel width compared to Wi-Fi 6, which allows for. Wi-Fi access points (WAPs, or APs) are wireless host devices that can handle multiple Wi-Fi-enabled clients simultaneously. In that sense, they are similar to extenders, with one significant difference: the way they connect to the network. In this video, we'll walk you through the entire process, from understanding the basics to installing and testing your new setup.
