

Huawei Terminal Switch Access Devices

Overview

The terminal access allows Ethernet access using LAN switches, WLAN access using APs, and asymmetric digital subscriber line (ADSL) access using digital subscriber line access multiplexers (DSLAMs). This document describes the Huawei Terminal Access Controller Access Control System (HWTACACS), including the relationship between TACACS, TACACS+, and HWTACACS, the compatibility between HWTACACS and TACACS+, the comparison between HWTACACS and RADIUS. After a while HWTACACS has become a standard protocol that is supported by all vendors. If you would like to learn more on RADIUS. SNMPWalk: SNMPWalk is a command-line tool that utilizes Simple Network Management Protocol (SNMP) to retrieve information from network devices. It can be used to gather data from Huawei switches, such as interface statistics, VLAN information, and system details. It supports access of 100 to 500 terminals of a small-sized enterprise to the NMS, and applies to scenarios of terminal address assignment and terminal user.
