Relay Protection Test Wiring Method

Overview

One approach to test the total protection system is to use primary injection techniques (see appendix H) that trigger protective relays and lockout relay, trip circuit breakers, and initiate annunciations and indications. If applicable, documentation is required detailing how verified protection segments overlap to ensure there is not a gap. The purpose of this Standard Work Practice (SWP) is to standardise and describe the method for testing of Ergon Energy protection relays for commissioning purposes. This SWP should be interpreted in conjunction with Standard for Substation Protection (V1. From a technician's perspective, master the unique skill of testing protection. When the transformer wiring type is Y/Y (Y0), the test wiring is very simple: when testing phase A, the tester IA is connected to the phase A of the high voltage side, and the tester IB is connected to the phase a of the low voltage side. After the neutral line of the high and low voltage sides is. Function: Use electronic components like transistors to perform switching. Applications: Frequency, undervoltage, and overcurrent protection.
