

Switch Optical Port Speed Test Experiment Report

Overview

Abstract—This paper presents the experimental results of the switching performances of the fast reconfigurable optical cross-point switch (OXs) matrix. This paper demonstrates unicast optical packet switching for a 10-Gb/s payload at various modulation formats. Abstract We fabricate a polarization-independent electro-optic Silicon-Photonic circuit that monolithically integrates Mach-Zehnder interferometer switches and filters for creating a fast and high-port-count optical switch. Design integrity of the switch is verified by $3,712 \times 3,712$ switch. Sources to increase utilization while reducing costs is critical. However, just using traditional layer 2/3 infrastructure to interconnect equipment test beds adds complexity, is prohibitively expensive, and equipment needs to be upgraded every time traffic speeds or formats change. We detail the design, manufacture, deployment, and end-to-end operation of a 128-port optical rotor switch along with supporting NIC hardware and host.
